Revision Comparison

Clarify the acting component

LANGUAGE-ONLY / SYNTHETIC EXAMPLE

Goal. Name the acting component and shorten one passive construction. The model and evaluation remain unchanged.

Shared context / Method, paragraph 1 / both versions

The feature extractor produces $h(x)$ and remains frozen. The gate g_θ is the only trainable component.

C1 / BEFORE — **Method, paragraph 2**

It acts on $h(x)$, and it controls which coordinates reach the classifier.

C1 / AFTER — **Method, paragraph 2**

The gate g_θ acts on $h(x)$ and controls which coordinates reach the classifier.

C1 / Reason / editor-proposed

Name the gate and remove the repeated subject. This clarity edit does not mean the original sentence was grammatically invalid.

Meaning and review. Exposition-only. Checked against the shared definition: the gate, features, and coordinate-selection role are preserved. No scientific validity audit was performed.

C2 / BEFORE — **Method, paragraph 3**

The gated features are used by the classifier. The extractor is not updated.

C2 / AFTER — **Method, paragraph 3**

The classifier uses the gated features. The extractor is not updated.

C2 / Reason / editor-proposed

The shorter active construction names the same consumer. Passive voice is not inherently an error; this is an optional expression improvement.

Meaning and review. Exposition-only. The frozen-extractor condition remains verbatim. No formulas, numbers, citations, or evaluation claims change.

Versions. `before.md` and `after.md`; hashes in `identity.json`. **Coverage.** Both complete source files were compared. C1 and C2 cover the changed paragraphs; the title, headings, shared definition, and Evaluation are retained. `after.md` is the sole proposal. No edits are applied. This PDF renders the quoted Markdown prose; raw source remains available.
