# Revision Comparison

Clarify the acting component

LANGUAGE-ONLY / SYNTHETIC EXAMPLE

**Goal.** Make clear that the gate acts on the features and shorten one sentence. The model and evaluation remain unchanged.

**Shared context / Method, paragraph 1 / both versions**

The feature extractor produces $h(x)$ and remains frozen. The gate $g_\theta$ is the only trainable component.

**C1 / BEFORE** — **Method, paragraph 2**

It acts on $h(x)$, and it controls which coordinates reach the classifier.

**C1 / AFTER** — **Method, paragraph 2**

The gate $g_\theta$ acts on $h(x)$ and controls which coordinates reach the classifier.

**C1 / Reason / editor-proposed**

Naming the gate makes clear which component acts on the features. The second "it" is no longer needed. The original sentence is grammatical.

**Meaning and review.** Exposition-only. The gate, features, and coordinate-selection role match the shared definition in both versions.

**C2 / BEFORE** — **Method, paragraph 3**

The gated features are used by the classifier. The extractor is not updated.

**C2 / AFTER** — **Method, paragraph 3**

The classifier uses the gated features. The extractor is not updated.

**C2 / Reason / editor-proposed**

Put the classifier first and use the shorter "uses." The passive version is also grammatical.

**Meaning and review.** Exposition-only. The frozen-extractor condition remains verbatim. No formulas, numbers, citations, or evaluation claims change.

**Versions.** `before.md` and `after.md`; hashes in `identity.json`. **Coverage.** Both complete source files were compared. C1 and C2 cover the changed paragraphs; the title, headings, shared definition, and Evaluation are retained. `after.md` is the sole proposal. No edits are applied. This PDF renders the quoted Markdown prose; raw source remains available.
